Car Service Booking System

Stakeholder Interview Questions & Responses • System Requirement Analysis

Q1 **What is your comprehensive opinion regarding the current reliance on phone calls and manual records to manage car maintenance bookings?**

> **Answer:** In my opinion, the current manual process is highly inefficient, prone to human error, creates severe bottlenecks at the reception, and lacks any clear transparency for the customers who want to know what is happening with their vehicles.

Q2 **How would you evaluate the overall transparency and communication quality between the workshop staff and customers under the current traditional system?**

> **Answer:** I believe the communication quality is poor. Customers are forced to make multiple phone calls just to get a simple update, and staff members spend excessive time answering routine queries instead of focusing on actual workshop tasks.

Q3 **How do you usually feel when you experience unexpected delays or have extreme difficulty in getting a status update on your car?**

> **Answer:** I typically feel frustrated, anxious, and dissatisfied because the lack of communication leaves me uncertain about my schedule, transportation plans, and the final repair costs.

Q4 **What are your feelings towards completely replacing the paper-based booking log with a modern, digital tracking web platform?**

> **Answer:** I feel very optimistic, relieved, and enthusiastic about this digital transformation, as it promises to eliminate chaos, save valuable time, and provide a much more comfortable user experience.

Q5 **Could you describe how the current state of booking and tracking operates day-to-day inside the service center?**

> **Answer:** The current state relies heavily on physical notebooks, manual appointment logs, and scattered Excel sheets. There is no automated link between the front desk and the mechanics, making real-time status updates practically non-existent.

Q6 **How does the reception team currently handle scheduling conflicts or double-bookings when customers arrive at the same time?**

Answer: They handle them manually by negotiating delays on the spot, which often results in long waiting queues, angry customers, and disorganized workshop schedules.

Q7 **What are the main obstacles or limitations you observe in the daily workflow of the current service booking process?**

Answer: The main obstacles include lost reservation details, busy phone lines that prevent new bookings, absence of historical maintenance records, and zero visibility of the car's progress through different repair stages.

Q8 **What are the primary goals that the new "Car Service Booking with Status" system aims to achieve for both users and the business?**

Answer: The primary goals are to automate the entire booking lifecycle, provide real-time status tracking (such as Inspected, In Repair, and Ready for Pickup), streamline workflow efficiency, and drastically improve customer satisfaction.

Q9 **How do you expect the introduction of live status updates and notifications to impact the overall customer experience?**

Answer: It will profoundly improve the experience by giving customers total transparency and peace of mind, eliminating the anxiety of not knowing their car's condition, and reducing the need for constant phone inquiries.

Q10 **Is a key objective of this project to reduce the administrative workload on receptionists while optimizing the workshop's daily appointment capacity?**

Answer: Yes, absolutely. Reducing staff stress and maximizing workshop organization are core targets of the new system.
